

Supplementary File 1

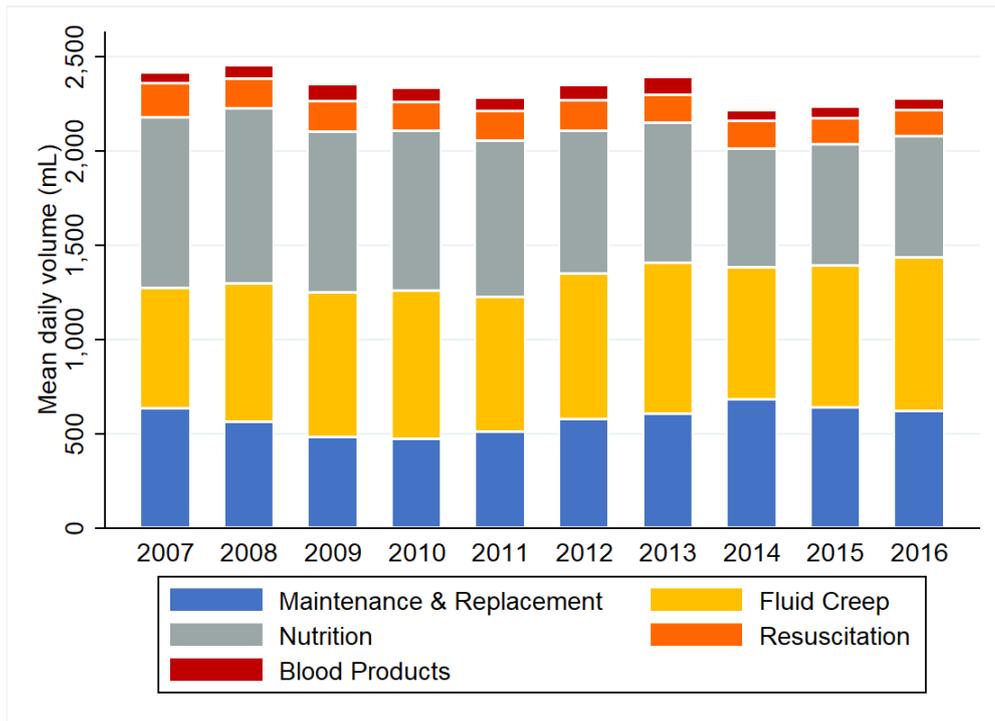

Figure S1a: Mean daily fluid volumes over a 10-year period. Mean duration of an average ICU-day 20.3 ± 6.7 h. Decrease in nutritional volume can be explained by the use of more concentrated forms of enteral nutrition.

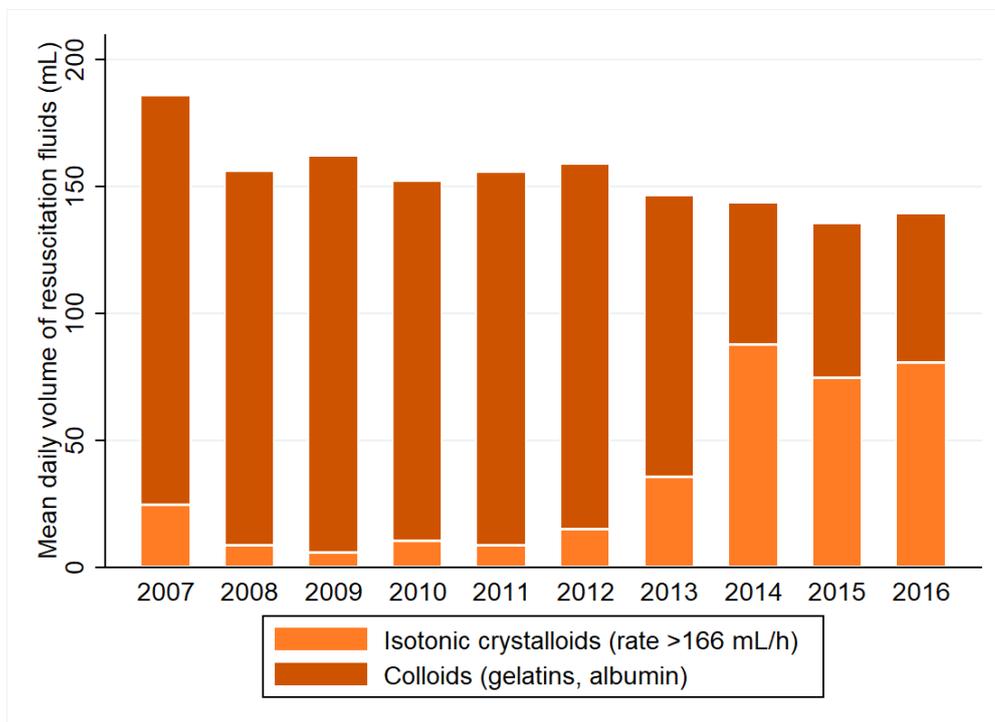

Figure S1b: Detail of Figure S1a showing only mean daily volumes of resuscitation fluids over a 10-year period. After the pivotal 6S and CHEST trials in 2012, colloid use (mainly gelatins and human albumin 20%) quickly decreased in favor of isotonic crystalloids (mainly PlasmaLyte 148)
